六、 APPLICATION

1、 POWER OUTPUT STAGE

The ACM298N integrates two power output stages (A ; B).The power output stage is a bridge configuration and its outputs can drive an inductive load in common or differenzial mode, depending on the state of the inputs. The current that flows through the load comes out from the bridge at the sense output : an external resistor (RSA ; RSB.) allows to detect the intensity of this current.

2、 INPUT STAGE

All the inputs are TTL compatible

3、 POWER

A non inductive capacitor, usually of 100 nF, must be foreseen between both Vs and Vss, to ground, as near as possible to GND pin.The en terminal shall be in L state before the output protection is turned off and on.

4、 OUTPUT PROTECTION

The fast diode shall be selected as the output protection when driving inductive load. When I = 2 A, VF $\leqslant$ 1.2V, TRR $\leqslant$ 200 ns.

5、 PARALLEL CONNECTION

When the driving current is greater than 2A, two groups can be connected in parallel for current expansion.
